MySQL from R – øvelse med emp-databasen

1. SQL

1. Lav et ER-diagram
2. Identificer fremmednøgler
3. Er der afdelinger der ikke har medarbejdere?
 1. slide om joins
4. Indsæt dig selv som medarbejder
5. Opret en afdeling og indsæt dig selv
6. Lav en liste over medarbejdere og tilhørende chefer

2. R

MySQL from R – øvelse med emp-databasen - joins

What is Inner Join?

An Inner Join returns only the rows that have matching values in both the tables (we are considering here the join is done between the two tables).

What is Outer Join?

The Outer Join includes the matching rows as well as some of the non-matching rows between the two tables. An Outer join basically differs from the Inner join in how it handles the false match condition.

There are 3 types of Outer Join:

- **Left Outer Join:** Returns all the rows from the LEFT table and matching records between both the tables.
- **Right Outer Join:** Returns all the rows from the RIGHT table and matching records between both the tables.
- **Full Outer Join:** It combines the result of the Left Outer Join and Right Outer Join.

MySQL – News API

Fremstil disse to data-enheder vha new-api'et

- gem credentials i .Renviron
- byg en funktion med flg signatur:
 - `getnews <- function(xdate,ydate,kw)`
- funktionen skal kaldes i et for-loop
 - `tmpdf=getnews(bdate,adate,qparam)`
- dataframen skal gemmes i MySQL
